A GUIDE TO
FIRE & ACOUSTIC DATA
FOR COLD-FORMED STEEL FLOOR,
WALL & ROOF ASSEMBLIES
(June 2013)

Supported By:
DISCLAIMER

The material in this guide has been prepared as a reference of fire and sound rated lightweight steel framed assemblies. While every effort has been taken to ensure that the material is technically correct, it only offers a brief description of the tested assemblies. It must not be used without first reviewing the source documents of the testing agencies for a full description of the assembly. The Steel Framing Alliance, nor their organization’s members, warrant or assume liability for the suitability of the material for any general or particular use.

Please note that some assemblies are constructed with proprietary products that may not be available in all geographical areas. Please consult the source documents of the testing agencies for these details. Where fire rated designs utilize a proprietary steel joist, fluted unit, light gauge steel truss or steel stud, the source column appears shaded and the word proprietary is in bold font to allow ease of identification for an assembly built with a proprietary cold-formed steel product.

Steel Framing Alliance

PREFACE

The purpose of this guide is to summarize fire and sound data for steel floor, wall and roof assemblies that are relevant to residential and light commercial construction. Fire data has been compiled from the following six sources:

Underwriters Laboratories of Canada
7 Underwriters Road
Toronto, Ontario, Canada M1R 3B4
www.ulc.ca

National Research Council of Canada
Institute for Research in Construction
1200 Montreal Road
Ottawa, Ontario, Canada K1A OR6
www.irc.nrc-cnrc.gc.ca

Underwriters Laboratories Inc.
333 Pfingsten Road
Northbrook, Illinois, U.S.A. 60062-2096
www.ul.com

Gypsum Association
6525 Belcrest Road.
Suite 480
Hyattsville, Maryland, U.S.A. 20782
www.gypsum.org

Factory Mutual Global Research
FM Global Corporate Offices
270 Central Avenue
Johnston, Rhode Island, U.S.A. 02919-4923
www.fmglobal.com

Intertek Testing Services NA Inc.
545 E. Algonquin Road
Suite F
Arlington Heights, Illinois, U.S.A. 60005
www.intertek.com
www.spec-direct.com
NOTES

1. ULC Design Numbers (published in the Fire Resistance Directory of Underwriters Laboratories of Canada) and NRCC Report/Assembly Numbers (research publications of the Institute for Research in Construction, National Research Council of Canada) should be referenced when considering steel floor, wall and roof assembly designs in Canadian Building Code jurisdictions.

2. For non-load bearing wall assemblies, steel stud thickness as per ASTM C 645, Standard Specification for Nonstructural Steel Framing Members, where minimum thickness is specified as 0.0179 in. (0.455 mm) before application of protective coating or in conformance with Section 9.

3. UL non-load bearing wall and load bearing wall assemblies provide stud material thickness with a Manufacturers’ Standard Gauge (MSG) number. UL’s “BXUV.GuideInfo, Fire Resistance Ratings – ANSI/UL 263” provides the following thickness tables where an MSG is stated in the fire rated design.

For load-bearing steel studs:

<table>
<thead>
<tr>
<th>MSG</th>
<th>Minimum bare metal thickness (in.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>0.0329</td>
</tr>
<tr>
<td>18</td>
<td>0.0428</td>
</tr>
<tr>
<td>16</td>
<td>0.0538</td>
</tr>
<tr>
<td>14</td>
<td>0.0677</td>
</tr>
</tbody>
</table>

For non-load bearing steel studs:

<table>
<thead>
<tr>
<th>MSG</th>
<th>Minimum bare metal thickness (in.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>25</td>
<td>0.0179</td>
</tr>
<tr>
<td>22</td>
<td>0.0269</td>
</tr>
<tr>
<td>20</td>
<td>0.0329</td>
</tr>
<tr>
<td>18</td>
<td>0.0428</td>
</tr>
<tr>
<td>16</td>
<td>0.0538</td>
</tr>
</tbody>
</table>

4. Both the SFIA and the SSMA code compliance certification programs have developed minimum requirements that must be satisfied in order for a nonstructural stud to be considered an equivalent gauge stud (EQ stud). These criteria are to insure that the EQ stud will perform as well or better than the stud it replaces. A nonstructural EQ stud must meet the following criteria:

- Have an allowable or nominal bending moment that is at least equal to that of their traditional stud counterpart as listed in ASTM C645, Table 2.
- Must have developed and published composite limiting height tables in accordance with ICC-ES AC86 – 2010.
NOTES (continued)

• Must have published screw data (shear and pullout) that is equal or greater than the traditional ASTM C645 stud.
• Must pass the screw penetration test in ASTM C645.
• Must meet the corrosion protection requirements of ASTM C645.

Fire assemblies that have EQ studs listed within the assembly are indicated with the following symbol: \( \text{EQ} \) EQ studs can also be used in assemblies if they meet the minimum physical requirements described within the assembly.

Products delivered to the jobsite with SFIA or SSMA labels on the packaging assure the user that the studs are code compliant, meet the requirements above, and were subjected to independent third party certification to these requirements.

5. The majority of sound data that has been incorporated into this guide were based on the following report:

The above report has surveyed existing published sound test reports denoted in the source column by an alphanumeric acoustic test identifier. Letter prefixes in the identifier denote various acoustic testing laboratories. The report also provides numerous acoustic “estimates” and these have been noted with an asterisk that refers to the above report, i.e., Warnock (2008). The report is available as a Steel Framing Alliance Research Report (RP08-7) from their website (http://store.steelframingalliancestore.com/esofstorclan.html) as a free download in the form of an Adobe Acrobat file. Acoustic estimates were made with an acoustic “SOund Classification RATing EStimator” called “Socrates” that is available from the National Research Council of Canada via the following website:

Further information on “Socrates” is also available via the following website:

http://www.alfwarnock.info/sound/socindex.html

Acoustic data in some cases appears with the following codes to denote a material:

AIR – a gap in the construction (a layer of air with thickness)
NOTES (continued)

CAR-UND – carpet and underpad
CEMBRD – cement board (with thickness)
CER-PAD – ceramic tile and rubber pad
G – gypsum board (with thickness)
GFB – glass fiber batts (with thickness)
NI – no insulation
NRC – no resilient metal channels
RC - resilient metal channels
RFB – rock fiber (mineral wool) batts (with thickness)

6. Information on UL fire rated cold-formed steel truss assemblies is available from the Cold-Formed Steel Council via the following webpage:

http://www.cfsc.sbcindustry.com/docs/Fire_Assemblies_SSC.pdf

7. Details of UL and ULC listings for fire rated floor, wall and truss assemblies can be downloaded from the website of UL and ULC by using the alphanumeric fire identifier within a keyword search. For example, on the UL website enter the following information:

- go to UL website at:  http://www.ul.com/global/eng/pages/
- click on “Online Certifications Directory” located at the bottom, right side of webpage
- type in alphanumeric fire identifier, for example “L568” in keyword box and click on “Search”
- go to row with “Design No. L568” and click on “BXUV.L568”

Similarly for the ULC website enter the following information:

- go to ULC website at:  http://www.ul.com/canada/eng/pages/index.jsp
- click on “ULC Online Directories” located along left side of webpage
- in “Keyword” type in alphanumeric fire identifier, for example “M511” in keyword box and click on “Search”
- go to row with “Design No. M511” and click on “BXUVC.M511”

8. UL Floor and Load Bearing Wall Designs using cold-formed steel joists and studs can be used for Canadian application without a Load Restriction, i.e., a “Load Restricted Factor” equal to 1.00. Details regarding this restricted load use condition have been added to “BXUV7.GuideInfo, Fire Resistance Ratings - CAN/ULC-S101 Certified for Canada”. The percent load reductions in Table 1 of “BXUV7.GuideInfo” for typical assemblies are based upon loading calculated in
NOTES (continued)

accordance with the working stress design method as compared to loading calculated in accordance with the limit states design method. The fire resistance ratings for floors supported by cold-formed steel channels and walls supported by cold-formed steel studs do not have a Load Restriction Factor because the associated loads in Canada and the U.S. are based on the same standard: CSA S136-07, “North American Specification for the Design of Cold-Formed Steel Structural Members”, and ANSI/AISI S100-07, “North American Specification and Commentary for the Design of Cold-Formed Steel Structural Members”.

9. As per UL’s “BXUV.GuidInfo, Fire Resistance Ratings – ANSI/UL 263” and ULC’s “BXUVC GuidInfo, Fire Resistance Ratings (Guide No. 40 U18)” the dimensions and thickness (gauge) of steel studs and joists are minimums. The hourly ratings apply when the steel studs and joists are larger in thickness (heavier gauge) and/or have larger dimensions than specified in a design, or when the member spacing is less than what was tested.
ACKNOWLEDGEMENTS

The Steel Framing Alliance acknowledges Bill Kraft of the Steel Framing Alliance and George Frater of the Canadian Steel Construction Council as the Primary Authors of the first edition of this guide, which was published in 2004.

The Steel Framing Alliance is grateful to George Frater of the Canadian Steel Construction Council for his ongoing effort to keep this guide current and to serve as Primary Author of each of the updated editions, which were published in 2005, 2006, 2007, 2009, 2012 and 2013.

The Steel Framing Alliance also appreciates the guidance and feedback provided to the Primary Author by the members of the Fire and Acoustic Task Group of the Cold-Formed Steel Engineers Institute and more recently from a “Technical Review Board” composed of four steel industry members.

Acknowledgement is also made for the financial support provided by the Steel Stud Manufacturers Association for the NRCC Phase II joint research project on the Fire and Acoustical Performance of Floor Assemblies.

As per Technical Note no. 8, UL Floor/Ceiling and Load Bearing Wall assemblies using cold-formed steel joists and studs can be used for Canadian application. Details regarding this condition are given in “BXUV7.GuideInfo, Fire Resistance Ratings - CAN/ULC-S101 Certified for Canada”. UL Floor/Ceiling assemblies that can be used for Canadian application as per BXUV7 are listed below and the relevant assemblies are noted with a [BXUV7] symbol in the 1st column of the section showing UL Floor/Ceiling assemblies (see pages 18 to 42).

The following pages present floor/ceiling assemblies fire tested at NRCC during two multi industry (steel, wood, gypsum and insulation) fire testing programs that are reported on in two fire test reports, namely IR No. 764 (May 1998) and RR No. 184 (March 2005). The fire test report nos. appear in the source column and are followed by a “FF” fire test no. used in the report. Relevant NRCC acoustic reports are also listed below and these reference documents deal with acoustic data, i.e., values of Sound Transmission Class and Impact Insulation Class that have been established as an estimated value or from an acoustic test where the acoustic test no. appears in the source column.

NRCC IR-764 data for FF22 to FF27 (see pages 12 and 13)

Reference (fire data):

References (acoustic data):

NRCC RR-184 data for FF37 to FF74 (see pages 14 to 17)

Reference (fire data):

References (acoustic data):

**NOTE:** ULC Certification Bulletin No. 2003-08 (dated August 21, 2003) provides an official ULC permission for ULC listed and package labelled mineral fibre building insulation (processed from rock, slag and glass only) to be used in ULC non-load bearing wall assembly designs consisting of gypsum wallboard and steel or wood studs with a fire resistance rating not exceeding 2 hours when illustrated without insulation, without detracting from the rating assigned to the assembly.
The following page presents non-load bearing wall assemblies fire tested at NRCC during two multi industry (steel, wood, gypsum and insulation) fire testing programs that are reported on in two fire test reports, namely IR No. 674 (December 1994) and IR No. 675 (December 1994). The fire test report nos. appear in the source column and are followed by a “F” fire test no. used in the report. A relevant NRCC acoustic report is also listed below and this reference document deals with acoustic data, i.e., values of Sound Transmission Class that have been established as an estimated value or from an acoustic test where the acoustic test no. appears in the source column.

NRCC IR-674 data for F03 and F05 and IR-675 data for F07 to F11 (see page 80)

As per Technical Note no. 8, UL Floor/Ceiling and Load Bearing Wall assemblies using cold-formed steel joists and studs can be used for Canadian application. Details regarding this condition are given in “BXUV7.GuideInfo, Fire Resistance Ratings - CAN/ULC-S101 Certified for Canada”. UL Load Bearing Wall assemblies that can be used for Canadian application as per BXUV7 are listed below and the relevant assemblies are noted with a BXUV7 symbol in the 1st column of the section showing UL Load Bearing Wall assemblies (see pages 137 to 145).

The following pages present load bearing wall assemblies fire tested at NRCC during a multi industry (steel, wood, gypsum and insulation) fire testing program that is reported on in a fire test report, namely A-4222.2 (February 2002). The fire test report no. appears in the source column and is followed by a “F” fire test no. used in the report. A relevant NRCC acoustic report is also listed below and this reference document deals with acoustic data, i.e., values of Sound Transmission Class that have been established as an estimated value or from an acoustic test where the acoustic test no. appears in the source column.

NRCC A-4222.2 data for F26 to F39 (see pages 134 to 136)
